Hold LB for the shift layer (the LB+ lines). Small grey text is the key the AutoHotkey layer types. The left stick is the only native binding: without the layer (i76-remap.ahk, started by PLAY-i76.bat) the buttons do nothing.

Status. Pad layer: "deployed, verified on Mac/Windows" (RELEASE-PLAN section 1). The docs do not record a play test of the pad on this map. Changed 2026-10-03 and not yet played: LB + D-pad left / right (gears), B (cycle weapon), LB + RT (hardpoint 1), RB (handbrake). Connect the pad before launching. Without the AutoHotkey layer a pad has the left stick only: this map binds no pad button natively.

pedals: throttle / brake · rim: steer (native, no layer needed)

Hold button 6 (the lowest face button) for the shift layer: the **6+** lines. Small grey text is the key i76-remap.ahk types; buttons with (*hold*) keep their key down while pressed, the rest tap once. Steering and pedals are native (input.map) and work without the layer.

The black badge is the PC button number (Thrustmaster manual). The picture is a schematic of the PS4-layout rim; the face-button numbers follow the order the manual lists them (△ □ ○ × = 3 to 6) and have not been press-tested by symbol: if one is off, the numbers on the boxes are what counts.

Status. Wheel: "STATUS 2026-08-01: WORKING AND PLAYED" (WHEEL-T300.md). Buttons rebalanced 2026-08-08; of the rebalanced buttons the docs record only the held horn as confirmed in the game (FIGHTERSTICK.md).
